PRELIMINARY AMENDMENT

BOX PATENT APPLICATION

Assistant Commissioner for Patents
Washington, DC 20231

November 30, 2001

Sir:

The following Preliminary Amendments and Remarks are respectfully submitted in connection with the above-identified application.

AMENDMENTS

IN THE ABSTRACT OF THE DISCLOSURE:

Please replace the Abstract of the Disclosure with the rewritten Abstract of the Disclosure located below:

--Abstract of the Disclosure

A method for detaching a barrier means adapted to the end part of the suction device for closing an opening in the end part by the movement of a plunger intended for changing the volume of a cylindrical space provided in the end part whereby the barrier means is removed by bringing means for limiting the movement of the plunger in the cylindrical space, e.g. means intended for

09/980196

removing the disposable tip, in such a position that the plunger can be brought into contact with the barrier means for detaching the barrier means from the end part of the suction device.--

IN THE SPECIFICATION:

Please insert the following paragraph and headings before the paragraph beginning on page 1, line 3:

--This application is the national phase under 35 U.S.C. § 371 of PCT International Application No. PCT/FI00/00544 which has an International filing date of June 16, 2000, which designated the United States of America and was published in English.

BACKGROUND OF THE INVENTION

Field of the Invention--

Please insert the following heading before the paragraph beginning on page 1, line 13:

--Description of the Prior Art--

Please insert the following heading before the paragraph beginning on page 1, line 32:

--Summary of the Invention--

Please insert the following paragraph and heading after the paragraph ending on page 4, line 5:

--Further scope of the applicability of the present invention will become apparent from the detailed description given

hereinafter. However, it should be understood that the detailed description and specific examples, while indicating preferred embodiments of the invention, are given by way of illustration only, since various changes and modifications within the spirit and scope of the invention will become apparent to those skilled in the art from this detailed description.

Brief Description of the Drawings--

Please replace the paragraph beginning on page 4, line 7, with the following rewritten paragraph:

--The invention is described in the following in detail with embodiments by referring to the accompanying drawings which are given by way of illustration only, and thus are not limitative of the present invention, and in which--

Please add the following heading before the paragraph beginning on page 4, line 14:

--Detailed Description of the Preferred Embodiments--

In the Claims:

Please amend the claims as follows:

1.(Amended) A method in a suction device, such as a mechanical pipette, comprising a body and an associated end part with an open distal end directed away from the body for removably attaching a disposable tip enclosing a sample space for receiving a liquid sample, the end part of the suction device enclosing a

cylinder space containing a reciprocatingly movable means, a plunger, for changing the volume of the cylindrical space for receiving a sample to the tip and removing it therefrom, and to which end part of the suction device is adapted a barrier means to close an opening in the end part, wherein the barrier means adapted to the end part of the suction device are detached by moving the plunger first in the direction of the opening in the end part of the suction device into contact with the barrier means and then by moving the plunger in the direction of the said opening for removing the barrier means from the end part of the suction device.

2. (Amended) The method according to claim 1, wherein the suction device is provided with means which limit the movement of the plunger in the cylindrical space and which can be brought to at least one such position in which the plunger can be brought into contact with the barrier means adapted to the end part of the suction device for detaching the barrier means from the end part of the suction device.

3. (Amended) The method according to claim 1, wherein the means for limiting the movement of the plunger comprise of means intended for detaching the removably to the end part of the suction device attached disposable tip which are positioned in such a position that the plunger can be brought into contact with the barrier means adapted to the end part of the suction device.

4. (Amended) A method in the suction device, such as a mechanical pipette, comprising a body and an associated end part with an open distal end directed away from the body for removably attaching a disposable tip enclosing a sample space for receiving a liquid sample, the end part of the suction device enclosing a cylinder space containing a reciprocatingly movable means, a plunger, for changing the volume of the cylindrical space for receiving a sample to the tip and removing it therefrom, and to which end part of the suction device is adapted a barrier means to close an opening in the end part, wherein the barrier means adapted to the end part of the suction device are detached by moving the plunger first in the direction of the opening in the end part of the suction device in that way that a telescopic extension of the plunger comes into contact with the barrier means and then by moving the plunger in the direction of the said opening for removing the barrier means from the end part of the suction device.

5. (Amended) The method according to claim 4, wherein the suction device is provided with means which limit the movement of the plunger in the cylindrical space and which means can be brought to at least one such position in which the telescopic extension of the plunger can be brought into contact with the barrier means adapted to the end part of the suction device for

removing the barrier means from the end part of the suction device.

6. (Amended) The method according to claim 5, wherein the means for limiting the movement of the plunger comprise means intended for removing the removably to the end part of the suction device attached disposable tip which are positioned in such a position that the telescopic extension of the plunger can be brought into contact with the barrier means adapted to the end part of the suction device.

7. (Amended) The method according to one of claims 1-6, wherein the suction device is multichannel.

8. (Amended) A suction device comprising a body and an associated end part with an open distal end directed away from the body for removably attaching a disposable tip enclosing a sample space for receiving a liquid sample, the end part of the suction device enclosing a cylinder space containing a reciprocatingly movable means, a plunger, for changing the volume of the cylindrical space for receiving a sample to the tip and removing it therefrom, and means for detaching the disposable tip removably attached to the end part, wherein the suction device is provided with means which limit the movement of the plunger in the cylindrical space and which can be brought to at least one position in which the plunger can be brought into contact with

the barrier means adapted to the end part of the suction device for detaching the barrier means from the end part of the suction device.

9. (Amended) The suction device according to claim 8, wherein the means in the suction device for detaching the disposable tip from the end part of the suction device can be brought to a position in which they limit the movement of the plunger in the cylindrical space.

10. (Amended) The suction device according to claim 8 or 9, wherein the suction device is multichannel.

REMARKS

The Abstract, specification, and claim 1-10 have been amended. Reconsideration of the application, as amended, is respectfully requested.

The specification has been amended to provide a cross-reference to the previously filed International Application, and the add headings to place the specification in better form for U.S. practice. The Abstract and claims have been amended to remove reference numerals and also to place them in better form for U.S. practice.

Entry of the above amendments is earnestly solicited. An early and favorable first action on the merits is earnestly solicited.

If necessary, the Commissioner is hereby authorized in this, concurrent, and future replies, to charge payment or credit any overpayment to Deposit Account No. 02-2448 for any additional fees required under 37 C.F.R. § 1.16 or under 37 C.F.R. § 1.17; particularly, extension of time fees.

Respectfully submitted,

A heading has been added before the paragraph beginning on page 4, line 14.

IN THE CLAIMS:

The claims have been amended as follows:

1.(Amended) A method in a suction device, such as a mechanical pipette, comprising a body [(1)] and an associated end part [(2)] with an open distal end directed away from the body for removably attaching a disposable tip [(3)] enclosing a sample space [(11)] for receiving a liquid sample, the end part [(2)] of the suction device enclosing a cylinder space [(4)] containing a reciprocatingly movable means [(6)], a plunger, for changing the volume of the cylindrical space [(4)] for receiving a sample to the tip [(3)] and removing it therefrom, and to which end part [(2)] of the suction device is adapted a barrier means [(12)] to close an opening [(5)] in the end part [(2)], [**characterized** in that] wherein the barrier means [(12)] adapted to the end part [(2)] of the suction device are detached by moving the plunger [(6)] first in the direction of the opening [(5)] in the end part [(2)] of the suction device into contact with the barrier means [(12)] and then by moving the plunger [(6)] in the direction of the said opening [(5)] for removing the barrier means [(12)] from the end part [(2)] of the suction device.

2. (Amended) [A] The method according to claim 1, **[characterized in that]** wherein the suction device is provided with means [(8,9)] which limit the movement of the plunger [(6)] in the cylindrical space [(4)] and which can be brought to at least one such position in which the plunger [(6)] can be brought into contact with the barrier means [(12)] adapted to the end part [(2)] of the suction device for detaching the barrier means [(12)] from the end part [(2)] of the suction device.

3. (Amended) [A] The method according to claim 1, **[characterized in that]** wherein the means [(8,9)] for limiting the movement of the plunger [(6)] comprise of means [(10)] intended for detaching the removably to the end part [(2)] of the suction device attached disposable tip [(3)] which are positioned in such a position that the plunger [(6)] can be brought into contact with the barrier means [(12)] adapted to the end part [(2)] of the suction device.

4. (Amended) A method in the suction device, such as a mechanical pipette, comprising a body [(1)] and an associated end part [(2)] with an open distal end directed away from the body for removably attaching a disposable tip [(3)] enclosing a sample space [(11)] for receiving a liquid sample, the end part [(2)] of the suction device enclosing a cylinder space [(4)] containing a reciprocatingly movable means [(6)], a plunger, for changing the volume of the cylindrical space [(4)] for receiving a sample to the tip [(3)] and removing it therefrom, and to which end part [(2)] of the suction device is adapted a barrier means [(12)] to close an opening [(5)] in the end part [(2)], **[characterized in that]** wherein the barrier means [(12)] adapted to the end part [(2)] of the suction device are detached by moving the plunger [(6)] first in the direction of the opening [(5)] in the end part [(2)] of the suction device in that way that a telescopic extension of the plunger [(6)] comes into contact with the

barrier means [(12)] and then by moving the plunger [(6)] in the direction of the said opening [(5)] for removing the barrier means [(12)] from the end part [(2)] of the suction device.

5. (Amended) [A] The method according to claim 4, [**characterized** in that] wherein the suction device is provided with means [(8, 9)] which limit the movement of the plunger [(6)] in the cylindrical space [(4)] and which means can be brought to at least one such position in which the telescopic extension of the plunger [(6)] can be brought into contact with the barrier means [(12)] adapted to the end part [(2)] of the suction device for removing the barrier means [(12)] from the end part [(2)] of the suction device.

6. (Amended) [A] The method according to claim 5, [**characterized** in that] wherein the means [(8, 9)] for limiting the movement of the plunger [(6)] comprise means [(10)] intended for removing the removably to the end part [(2)] of the suction device attached disposable tip [(3)] which are positioned in such a position that the telescopic extension of the plunger [(6)] can be brought into contact with the barrier means [(12)] adapted to the end part [(2)] of the suction device.

7. (Amended) [A] The method according to one of claims 1-6, [**characterized** in that] wherein the suction device is multichannel.

8. (Amended) A suction device comprising a body [(1)] and an associated end part [(2)] with an open distal end directed away from the body for removably attaching a disposable tip [(3)] enclosing a sample space [(11)] for receiving a liquid sample, the end part [(2)] of the suction device enclosing a cylinder space [(4)] containing a reciprocatingly movable means [(6)], a plunger, for changing the volume of the cylindrical space [(4)]

for receiving a sample to the tip [(3)] and removing it therefrom, and means [(10)] for detaching the disposable tip [(3)] removably attached to the end part [(2)], [**characterized** in that] wherein the suction device is provided with means [(8, 9)] which limit the movement of the plunger [(6)] in the cylindrical space [(4)] and which can be brought to at least one position in which the plunger [(6)] can be brought into contact with the barrier means [(12)] adapted to the end part [(2)] of the suction device for detaching the barrier means [(12)] from the end part [(2)] of the suction device.

9. (Amended) [A] The suction device according to claim 8, [**characterized** in that] wherein the means [(10)] in the suction device for detaching the disposable tip [(3)] from the end part [(2)] of the suction device can be brought to a position in which they limit the movement of the plunger [(6)] in the cylindrical space [(4)].

10. (Amended) [A] The suction device according to claim 8 or 9, [**characterized** in that] wherein the suction device is multichannel.

Suction device

The object of this invention is a method to be used in a suction device, such as a mechanical pipette, comprising a body and an associated end part with an open
5 distal end directed away from the body for removably attaching a disposable tip enclosing a sample space for receiving a liquid sample, the end part of the suction device enclosing a cylinder space containing a reciprocatingly movable means for changing the volume of the cylindrical space for receiving a sample to the tip and removing it therefrom, for removing a barrier means adapted to the end part of the
10 suction device and closing the opening in the end part. The object of the invention is also a suction device for employing the method.

In electronic as well as in mechanical suction devices, pipettes, barrier means are used in their end part to prevent liquids or reagents to be dispensed or molecules
15 vaporizing from them from entering the inner parts of the pipette. These liquids or vaporized molecules in entering the inner parts of the pipette can contaminate the said inner parts and further in moving over from one sample to another can cause the contamination of the other sample. Samples and/or reagents can be valuable and in any case in the laboratory work cannot be accepted anything that
20 deteriorates the reliability of the operation.

The barrier means are usually adapted to cover the opening in the end part of the suction device forming a gaseous passage between the cylindrical space in the end
25 part of the suction device and a sample space of the disposable tip to be attached removably to the end part of the suction device. The barrier means attach to the end part of the suction device, to the opening therein and/or to the cylindrical space so that they can easily be removed when desired.

The removal of the barrier means manually exposes the user of the suction device
30 to samples or reagents which may be poisonous or dangerous.

To solve this problem, in the method according to the invention the barrier means are removed with the movement of the plunger, which is reciprocatingly movable

in the cylindrical space of the suction device and which is intended for changing the volume of the cylindrical space. The said plunger is moved in the cylindrical space for taking samples or reagents into the disposable tip attached to the suction device, for dispensing and/or for removing them from the said tip. In these
5 operations the plunger is moved between its two extreme positions, of which the first one with the plunger drawn into the cylinder corresponds the maximal suction, and of which the second one with the plunger coming to the vicinity of the opening in the end part of the suction device corresponds to the removal of the sample. For moving the plunger, the body of the suction device comprises
10 operating means in association with the plunger. The suction device has preferably also means in association with the operating means for limiting the movement of the plunger in the cylindrical space.

The disposable tip attached to the suction device, onto the end of its end part, is
15 removed in some suction devices with a sleeve movable on the end of the end part. The moving of the sleeve can take place as a separate operation directly manually or with separate means such as levers or bars. The sleeve can in some cases also be moved with means in association with the operating means of the said plunger or the means associated with the moving of the sleeve can be made
20 in association with the operating means of the plunger or with means in association with it for removing the disposable tip by means of the sleeve.

The barrier means in the suction devices are removed from the suction device after the removal of the disposable tip when necessary, the barrier means are generally
25 not always removed in connection of the removal of the disposable tip.

It is characteristic for the method according to the invention that the barrier means adapted to the end part of the suction device are removed by moving the plunger first in the direction of the opening in the end part of the suction device in contact
30 with the barrier means and then by moving the plunger in the direction of the said opening for removing the barrier means from the end part of the suction device.

To prevent the unintentional or not-intended removal of the barrier means, the means for limiting the movement of the plunger in the cylindrical space are brought in one preferred embodiment of the method according to the invention in such a position in which the plunger cannot be moved into contact with the barrier means. When the barrier means are desired to be removed, the means limiting the movement of the plunger are brought in such a position that the plunger can be moved in contact with the barrier means and that in moving the plunger further in the direction of the opening in the end part, the movement of the plunger removes the barrier means from the end part of the suction device.

10

It is also characterizing to the suction device according to the invention that the suction device is provided with means which limit the movement of the plunger in the cylindrical space and which can be brought into at least one position in which the plunger can be brought in contact with the barrier means adapted to the end part of the suction device for removing the barrier means from the end part of the suction device.

15

In a preferred embodiment of the invention as means which limit the movement of the plunger and prevent the moving of the plunger into contact with the barrier means are used preferably means for removing the disposable tip such as e.g. the sleeve movable on the end of the end part and/or means associated with it, which means can be positioned with regard to the plunger and/or its operating means and/or means associated with them in a plurality of positions for limiting the movement of the plunger. When the user wants to remove the barrier means, the user selects such a position among the mutual positions between the plunger, its operating means and/or means associated with them, and the sleeve and/or means associated with it, in which the plunger can be moved into contact with the barrier means and in which position the plunger can further be moved for removing the barrier means.

20

25

30

In a preferred embodiment of the invention, the plunger is never brought directly into contact with the barrier means, but the plunger is provided with means, which

in moving the plunger towards the opening in the end part of the suction device, can be brought into contact with the barrier means and which in continuing the movement of the plunger bring about the removal of the barrier means from the end part of the suction device. These means are in a preferred embodiment of the invention a telescopic extension of the plunger.

The invention is described in the following in detail with embodiments by referring to the accompanying drawings in which

figure 1 presents a longitudinal cross-section of the suction device.

In the figures like reference numbers are used for like parts.

In figure 1 the body of the suction device is referenced with reference number 1 and the end part removably attached thereon with reference number 2. The end part 2 encloses a cylindrical space 4 having a reciprocatingly movable means 6, a plunger, for changing the volume of the cylindrical space 4. For moving the plunger 6 in the cylindrical space the suction device is provided with operating means 7 in association with the plunger 6. A disposable tip 3 provided with a sample space 11 for liquid samples can be attached to the end part 2 of the suction device. The end of the end part 2 is provided with an opening 5 forming a gaseous passage between the cylindrical space 4 and the sample space 11 of the disposable tip 3. A barrier means 12, permeable to gases but impermeable to liquids, is adapted to cover the opening 5 in the end of the end part 2, the barrier means preventing the entry of the samples or reagents or the molecules possibly vaporizing from them into the inner parts of the suction device.

In figure 1 means 8 are shown which together with the means 9 associated with the operating means 7 limit the movement of the plunger 6 in the cylindrical space 4. The means 8 can preferably be positioned to limit the movement of the plunger 6 in the cylindrical space or they can be positioned in such a position with regard

to the plunger 6, its operating means 7, or means 9 associated with them, that they do not limit the movement of the plunger 6.

In figure 1 are also shown schematically means 10 for removal of the disposable tip 3 from the end part 2 by using the movement of the plunger 6. When the plunger 6 is moved by the operating means 7, the means 9 associated with the operating means 7 can come in contact with the tip removal means 10 and in further moving the plunger 6 in the direction of the opening 5 in the end part 2 of the suction device, the means 10 come into contact with the disposable tip 3.

When the movement of the plunger 6 further continues in the direction of the opening 5 of the end part 2, the means 10 bring about with their movement the removal of the disposable tip 3 from the end part 2 of the suction device. In a preferred embodiment of the invention, the plunger 6 can be moved towards the opening 5 in the end part 2 of the suction device still after the detachment of the disposable tip 3.

The means 10 have in an embodiment of the invention preferably also another position, in which the means 10 can come into contact with the plunger 6 or with means associated with it, but in which position they prevent the movement of the plunger 6 towards the opening 5 in the end part 2 of the suction device.

Still in a preferred embodiment of the invention, the means 10 can be positioned in such a position that they allow the removal of the disposable tip 3 with the movement of the plunger 6, but prevent the plunger 6 from moving in the direction of the opening 5 in the end part 2 after detachment of the disposable tip 3.

In a preferred embodiment of the method according to the invention, the barrier means is detached from the end part 2 of the suction device by positioning the means 10 in such a position that the means 9 associated with the operating means 7 come into contact with the means 10, when the plunger 6 is moved with the operating means 7 towards the opening 5 in the end part 2 of the suction device.

When the plunger 6 is further moved towards the opening in the end part 2, the means 10 come into contact with the disposable tip 3 attached to the end part 2 and when the movement of the plunger 6 continues in the direction of the opening in the end part bring about the detachment of the disposable tip 3 from the end part 2 of the suction device. After the detachment of the disposable tip 3 the means 10 are positioned in another position, in which the plunger 6 can be moved towards the opening in the end part and in which position the plunger 6 moving further comes into contact with the barrier means 12 adapted to the end part 2 and when the movement continues towards the opening 5 in the end part 2, the plunger detaches the barrier means 12 from the end part 2 of the suction device.

In a preferred embodiment of the invention the means 10 can be positioned in such a position after the detachment of the barrier means 12, that the means in association with the plunger 6 can come into contact with the means 10. The movement of the plunger 6 back into the cylindrical space 4 brings about the movement of the means 10 away from the end part 2 of the suction device towards the body 1 of the suction device in such a position in which the disposable tip 3 can be attached on the end of the end part 2 of the suction device.

In a preferred embodiment of the invention the means 10 are at that time brought in such a position, in which the contact between the means 10 and the means associated with the plunger 6 loosens when moving the plunger 6 into the cylindrical space 4.

CLAIMS

1. A method in a suction device, such as a mechanical pipette, comprising a body (1) and an associated end part (2) with an open distal end directed away from the body (1) for removably attaching a disposable tip (3) enclosing a sample space (11) for receiving a liquid sample, the end part (2) of the suction device enclosing a cylinder space (4) containing a reciprocatingly movable means (6), a plunger, for changing the volume of the cylindrical space (4) for receiving a sample to the tip (3) and removing it therefrom, and to which end part (2) of the suction device is adapted a barrier means (12) to close an opening (5) in the end part (2),
10 **characterized** in that the barrier means (12) adapted to the end part (2) of the suction device are detached by moving the plunger (6) first in the direction of the opening (5) in the end part (2) of the suction device into contact with the barrier means (12) and then by moving the plunger (6) in the direction of the said
15 opening (5) for removing the barrier means (12) from the end part (2) of the suction device.
2. A method according to claim 1, **characterized** in that the suction device is provided with means (8,9) which limit the movement of the plunger (6) in the cylindrical space (4) and which can be brought to at least one such position in
20 which the plunger (6) can be brought into contact with the barrier means (12) adapted to the end part (2) of the suction device for detaching the barrier means (12) from the end part (2) of the suction device.
3. A method according to claim 1, **characterized** in that the means (8,9) for limiting the movement of the plunger (6) comprise means (10) intended for detaching the removably to the end part (2) of the suction device attached
25 disposable tip (3) which are positioned in such a position that the plunger (6) can be brought into contact with the barrier means (12) adapted to the end part (2) of the suction device.
30 the suction device.

4. A method in the suction device, such as a mechanical pipette, comprising a body (1) and an associated end part (2) with an open distal end directed away from the body (1) for removably attaching a disposable tip (3) enclosing a sample space (11) for receiving a liquid sample, the end part (2) of the suction device
5 enclosing a cylinder space (4) containing a reciprocatingly movable means (6), a plunger, for changing the volume of the cylindrical space (4) for receiving a sample to the tip (3) and removing it therefrom, and to which end part (2) of the suction device is adapted a barrier means (12) to close an opening (5) in the end part (2), **characterized** in that the barrier means (12) adapted to the end part (2)
10 of the suction device are detached by moving the plunger (6) first in the direction of the opening (5) in the end part (2) of the suction device in that way that a telescopic extension of the plunger (6) comes into contact with the barrier means (12) and then by moving the plunger (6) in the direction of the said opening (5) for removing the barrier means (12) from the end part (2) of the suction device.
15
5. A method according to claim 4, **characterized** in that the suction device is provided with means (8, 9) which limit the movement of the plunger (6) in the cylindrical space (4) and which means can be brought to at least one such position in which the telescopic extension of the plunger (6) can be brought into contact
20 with the barrier means (12) adapted to the end part (2) of the suction device for removing the barrier means (12) from the end part (2) of the suction device.
6. A method according to claim 5, **characterized** in that the means (8, 9) for limiting the movement of the plunger (6) comprise means (10) intended for
25 removing the disposable tip (3) attached removably to the end part (2) of the suction device which means are positioned in such a position that the telescopic extension of the plunger (6) can be brought into contact with the barrier means (12) adapted to the end part (2) of the suction device.
- 30 7. A method according to one of claims 1-6, **characterized** in that the suction device is multichannel.

8. A suction device comprising a body (1) and an associated end part (2) with an open distal end directed away from the body (1) for removably attaching a disposable tip (3) enclosing a sample space (11) for receiving a liquid sample, the end part (2) of the suction device enclosing a cylinder space (4) containing a reciprocatingly movable means (6), a plunger, for changing the volume of the cylindrical space (4) for receiving a sample to the tip (3) and removing it therefrom, and means (10) for detaching the disposable tip (3) removably attached to the end part (2), **characterized** in that the suction device is provided with means (8, 9) which limit the movement of the plunger (6) in the cylindrical space (4) and which can be brought to at least one position in which the plunger (6) can be brought into contact with the barrier means (12) adapted to the end part (2) of the suction device for detaching the barrier means (12) from the end part (2) of the suction device.
- 15 9. A suction device according to claim 8, **characterized** in that the means (10) in the suction device for detaching the disposable tip (3) from the end part (2) of the suction device can be brought to a position in which they limit the movement of the plunger (6) in the cylindrical space (4).
- 20 10. A suction device according to claim 8 or 9, **characterized** in that the suction device is multichannel.

COMBINED DECLARATION AND POWER OF ATTORNEY
FOR PATENT AND DESIGN APPLICATIONS

As a below named inventor, I hereby declare that: my residence, post office address and citizenship are as stated next to my name; that I verily believe that I am the original, first and sole inventor (if only one inventor is named below) or an original, first and joint inventor (if plural inventors are named below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

SUCTION DEVICE

Insert Title:

Information -
For Use Without
Specification
Attached:

the specification of which is attached hereto. If not attached hereto,
the specification was filed on _____ as
United States Application Number _____;
and amended on _____ (if applicable) and/or
the specification was filed on June 16, 2000 as PCT
International Application Number PCT/FI00/00544; and was
amended under PCT Article 19 on _____ (if applicable)

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, §1.56.

I do not know and do not believe the same was ever known or used in the United States of America before my or our invention thereof, or patented or described in any printed publication in any country before my or our invention thereof or more than one year prior to this application, that the same was not in public use or on sale in the United States of America more than one year prior to this application, that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representative or assigns more than twelve months (six months for designs) prior to this application, and that no application for patent or inventor's certificate on this invention has been filed in any country foreign to the United States of America prior to this application by me or my legal representatives or assigns, except as follows.

I hereby claim foreign priority benefits under Title 35, United States Code, §119(a)-(d) of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:
